This is an overview of the main dashboard of an application, that allows users to track their eating habits, and maintain a certain diet. It tracks daily meals and allows users to input the items they consumed.

The benefit of this application is that it allows doctors to monitor their patients remotely, and adjust their patients diet and medication.

Please redesign this interaction and show us how do you think this could be improved. Submit some screens (or even better, a prototype, but as this role is also UI, don't forget to send us some UI too!) along with a document that explains your decisions and show us what you got! For this assignment, there are no brand rules. Which means the overall look and feel is your choice.
